MK WORKSTATION

Fedora, finished.

One command turns a fresh Fedora Workstation into a fast, good-looking desktop that already works the way you do. Free and open source.

Fedora 44 · GNOME 50 · about 15 minutes

github.com/MehulK-techie/fedora-workstation-config

INSIDE

What you'll find

03 **Why it exists**
Great foundation, bare walls

04 **Moving between apps**
Swipes and a switcher that keeps up

05 **Windows that behave**
Snap layouts and tiling

06 **The dock**
Magnifies, glows, gets out of the way

07 **A desktop that says hello**
Greeting, tasks, your colours

08 **MK Notes**
Write, link, draw, find

09 **MK Notes: the rest**
Sync, PDF, website, history, tasks

10 **Focus timer**
Screensavers over your work

11 **The top bar**
System monitor and quick settings

12 **Apps, ready to go**
Joplin, ONLYOFFICE, Zen and more

13 **Made for your computer**
Fingerprint, battery, speakers

14 **Shortcuts you already know**
Windows and Mac habits

15 **Try it without worry**
Snapshots, restore, uninstall

16 **Get started**
Three commands

WHY IT EXISTS

Great foundation. Bare walls.

Fedora is one of the best Linux systems you can install. But out of the box it's a blank canvas: no codecs for most videos, a handful of apps, a desktop that works differently from the one you came from. Getting it right usually takes a weekend of forum posts.

- **Before** find extensions one by one, install codecs, hunt for shortcut settings, look for a notes app, fix what breaks after an update
- **After** run one command, make a coffee, log in to a desktop that's done
- **Not locked in** everything it changes is a normal GNOME setting or a normal app; undo it any time

1
command to set up the whole desktop

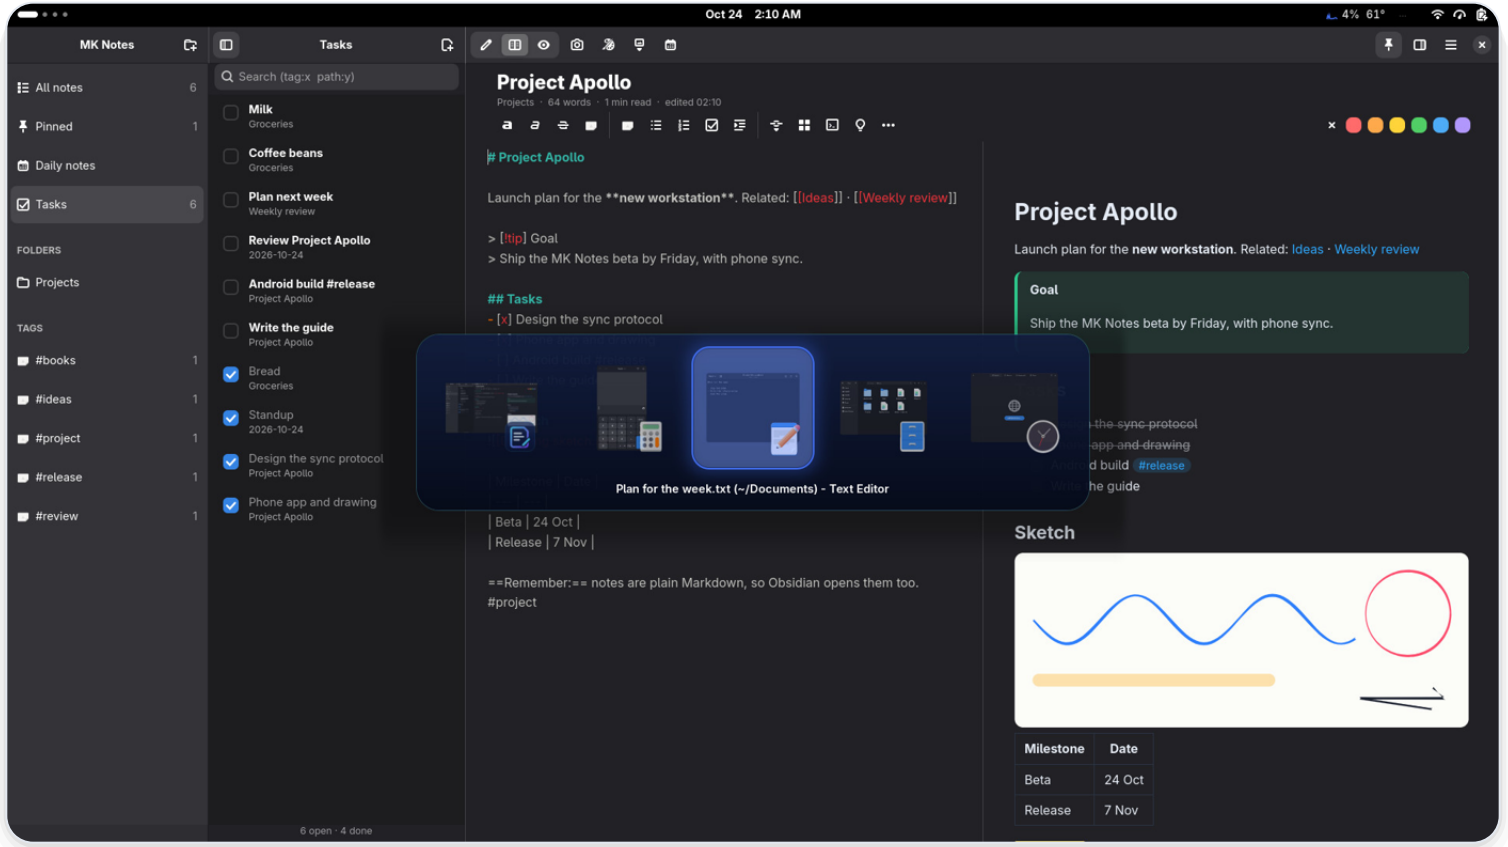

≈15 min
from fresh install to finished desktop

0
settings you have to look up

100%
open source, scripts you can read

MOVING BETWEEN APPS

Swipe through your windows

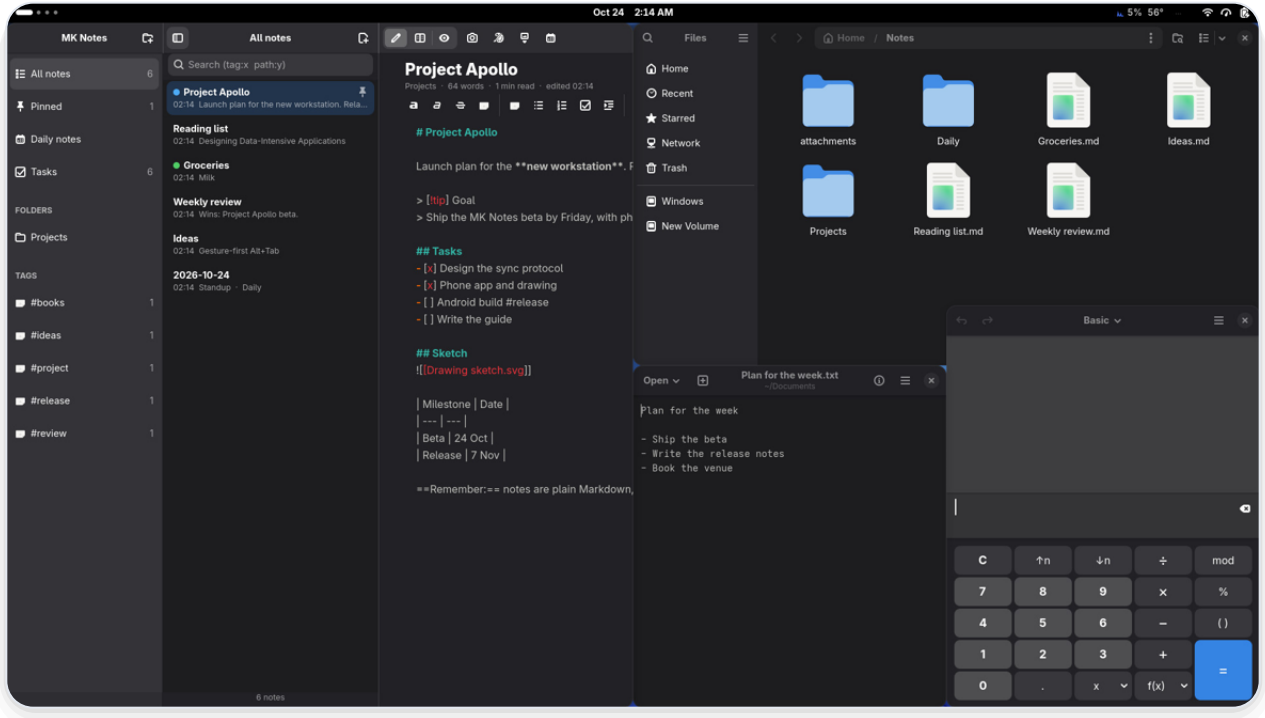

Alt+Tab or a three-finger swipe: one glowing ring glides to the window you want

- **Three fingers** left and right through every open window, on every workspace
- **Steady** each window takes the same finger travel, however many are open
- **Four fingers** switch workspaces; up for an overview of everything
- **Pinch** three fingers for volume, four to show the desktop
- **Alt+Tab** as fast as GNOME's own switcher, measured

WINDOWS THAT BEHAVE

Snap, tile, focus. No dragging.

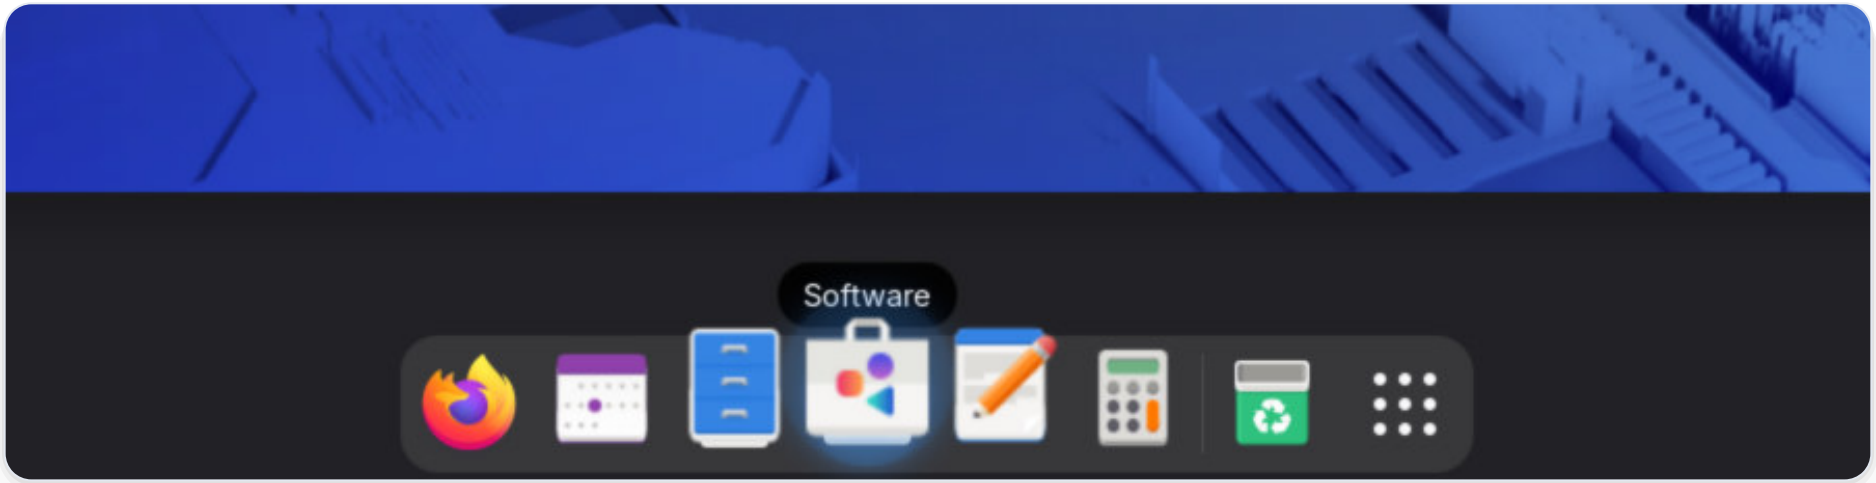

Notes on the left, files, a document and the calculator in the quarters

- **Snap layouts** Super+Z shows six layouts; pick one and the other windows fill in
- **Halves and quarters** Super and the arrow keys, the way Windows does it
- **Snap Assist** after you snap one window, it offers the rest for the free space
- **Always on top** Super+Ctrl+T keeps a video or a calculator above everything
- **New desktop** Super+Ctrl+D; Shift takes the current window along
- **Quick Look** press Space on a file in Files to preview it

THE DOCK

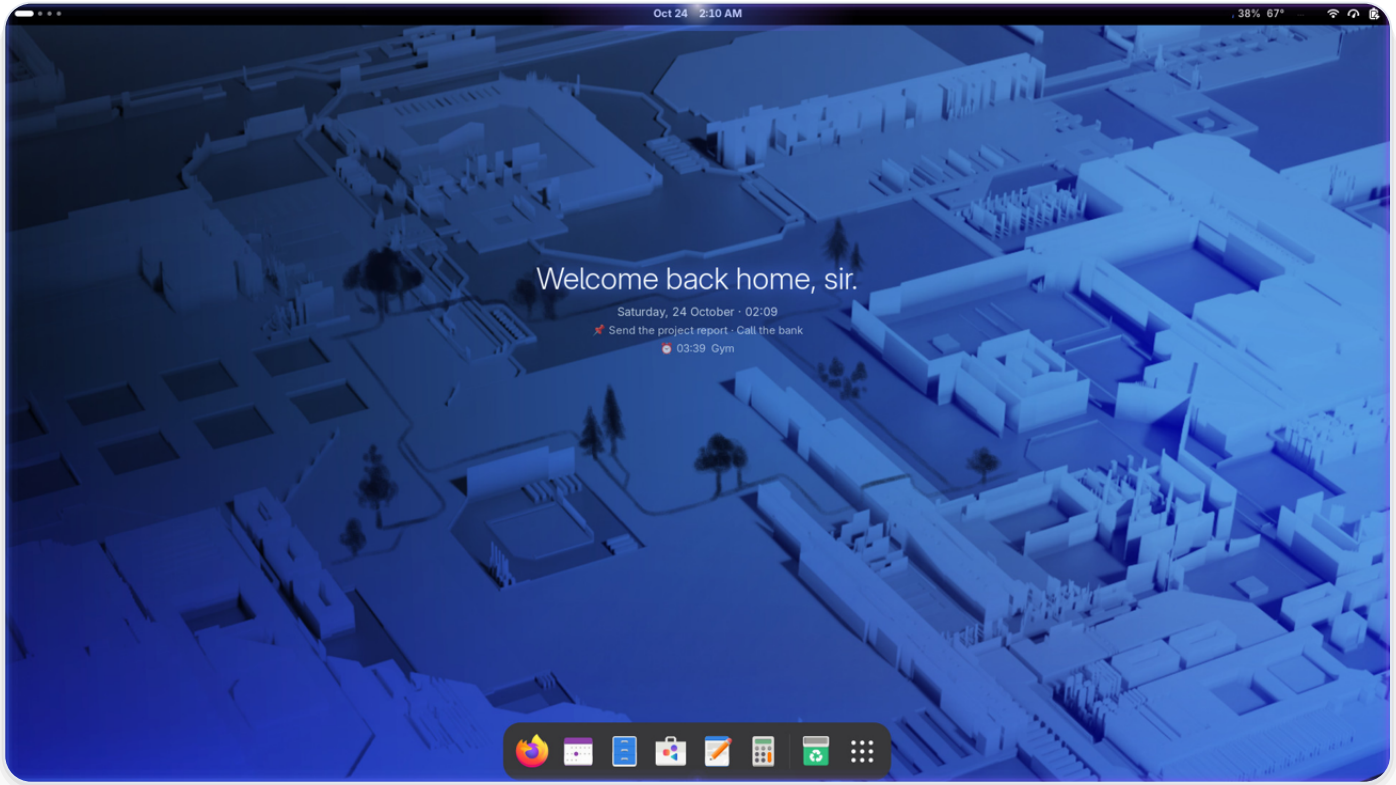

Out of the way until you want it

- **Magnifies** the icon under your pointer grows and its neighbours follow in a wave
- **Glows in each app's colour** worked out from the app's own icon
- **Hides** when a window touches it, and steps aside in the overview so titles stay readable
- **Works like a taskbar** click to focus or minimise; several windows show as thumbnails

AFTER YOU LOG IN

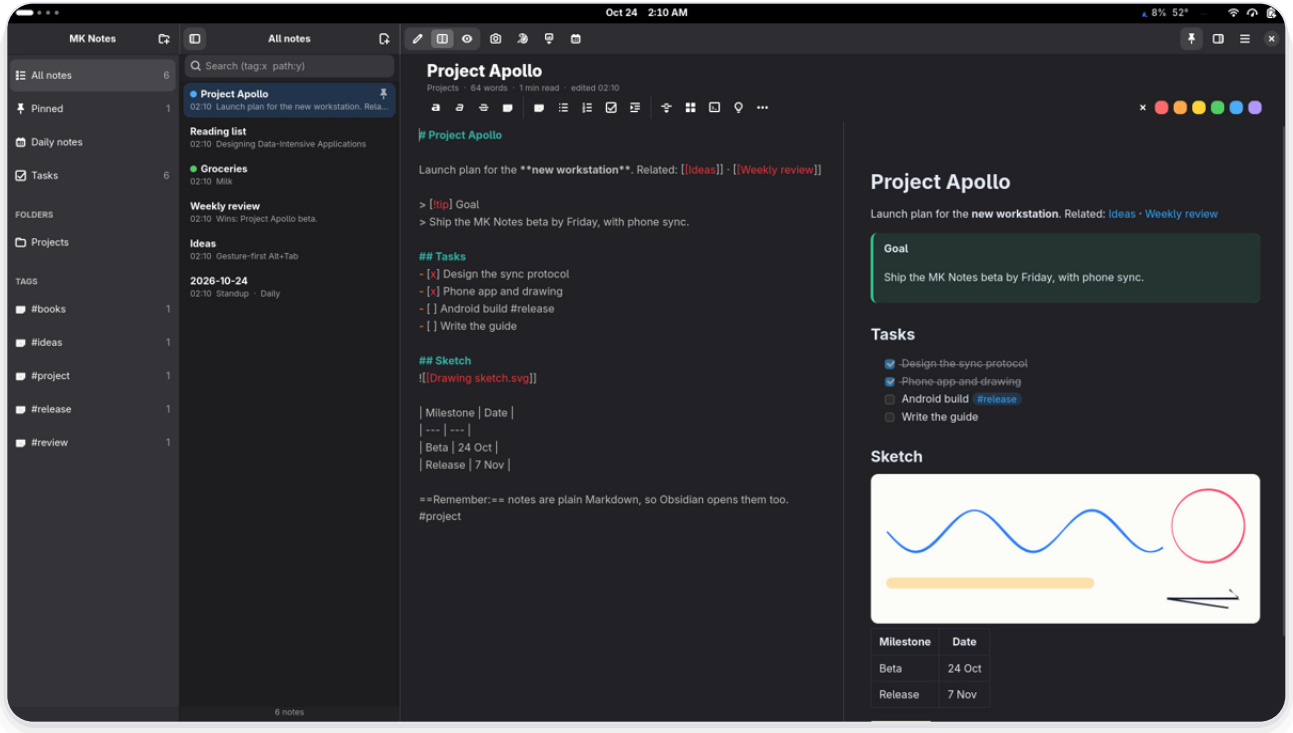

A desktop that says hello, and remembers

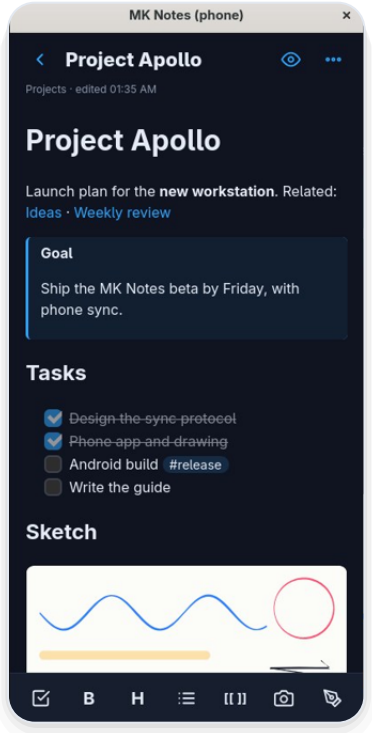

- **Light that lands on time** two comets run up the screen edges and meet at the top, once the desktop is ready, so it never stutters
- **What's waiting** your pinned tasks and the next reminder today, right under the greeting
- **Say it your way** your name, sir or ma'am, or your own line; spoken aloud if you like
- **Your colours** the whole desktop picks up the most vivid colour of your wallpaper

SUPER + N

MK Notes: write, link, draw, find

Edit with a live preview: links, callouts, checklists, a sketch

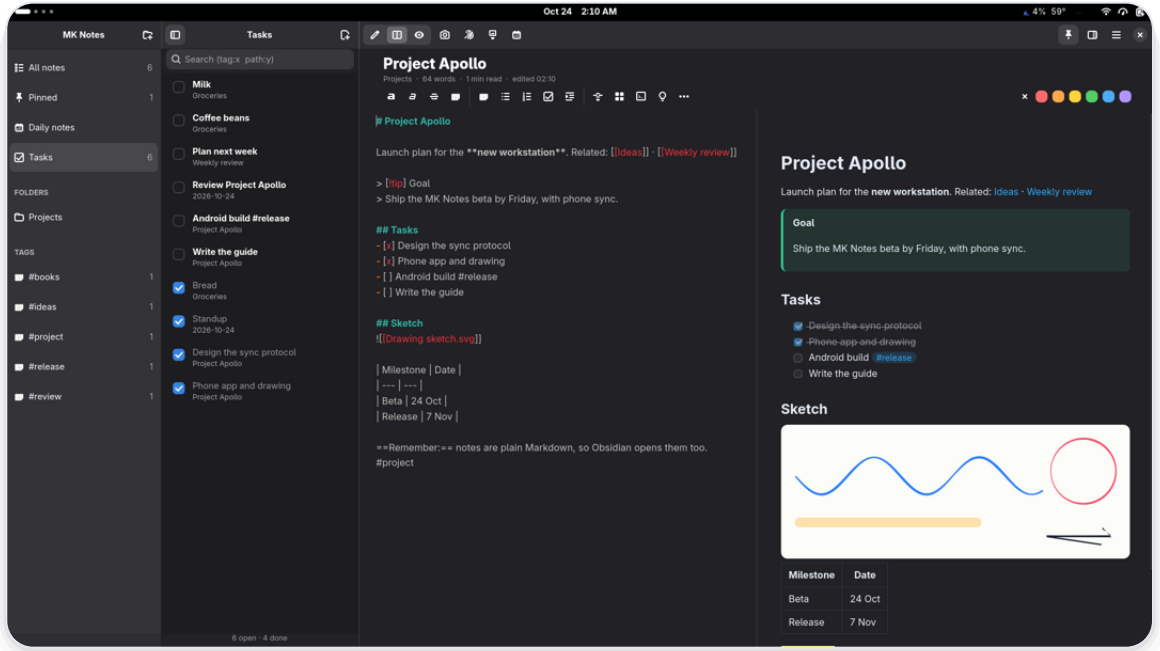

Same notes on your phone

- **Your files** plain Markdown in a folder you own; other apps open it too
- **Linked** [[links]], backlinks and a graph of how ideas connect
- **Drawn** sketch or handwrite with a pen, pressure and all
- **Pasted** screenshots go straight into the note

MK NOTES

The features you'd normally pay for

Every checkbox from every note, in one list

Phone sync
browser or Android app, works offline, syncs over your Wi-Fi

PDF export
one click, with pictures and checkboxes

Your website
publish your notes as pages you can host anywhere

Version history
go back to how a note looked this morning

Daily notes
a calendar marks the days you wrote

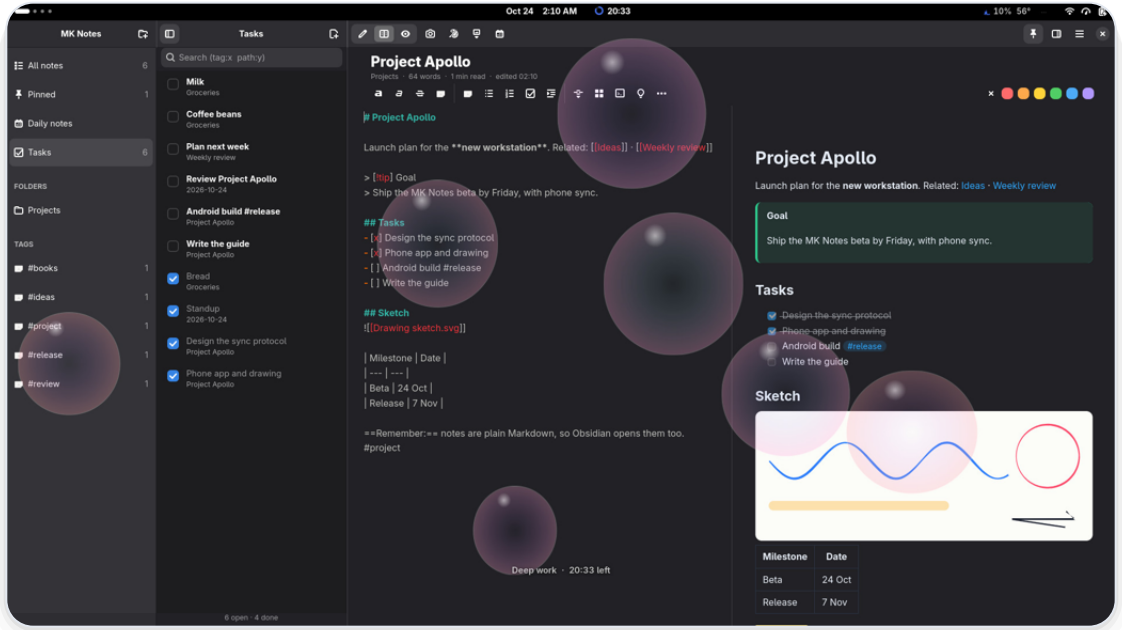

Focus mode
F11: nothing but the words

Your look
theme, font, size, line length, spacing

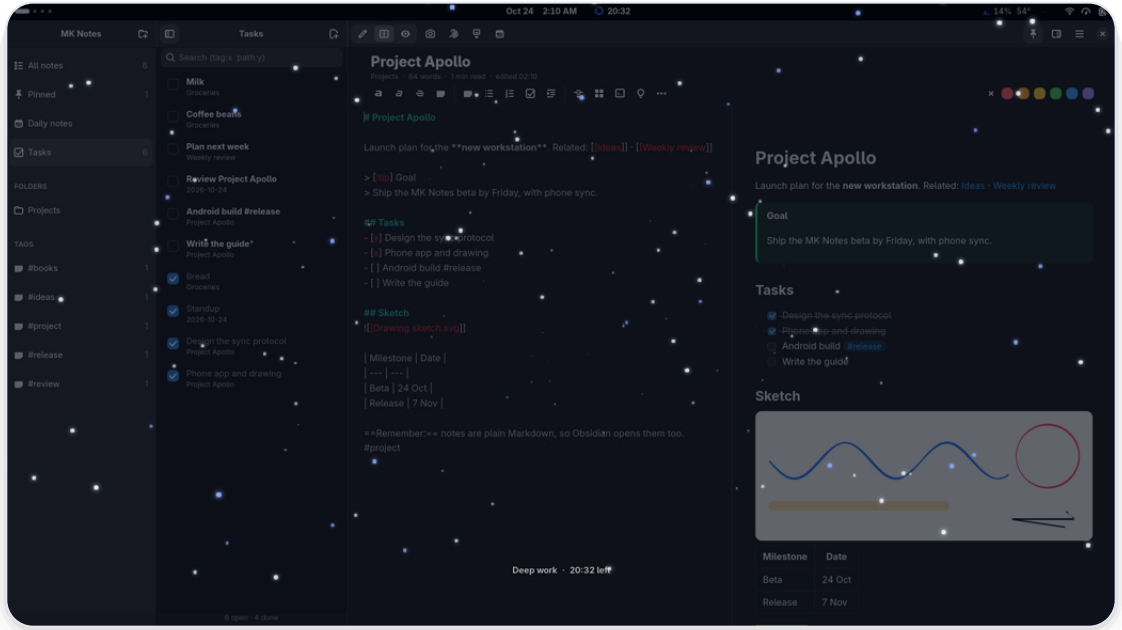

Tasks view
tick things off without opening the note

FOCUS TIMER

Step away. It notices.

Bubbles drift over your work...

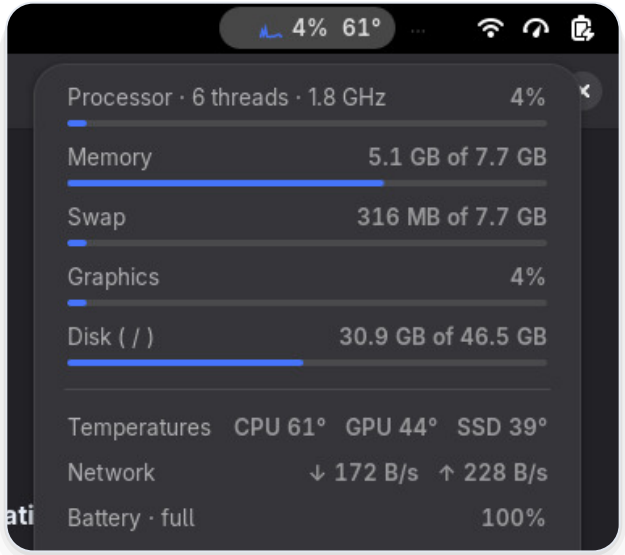

...or fly through the stars. Any touch and you're back.

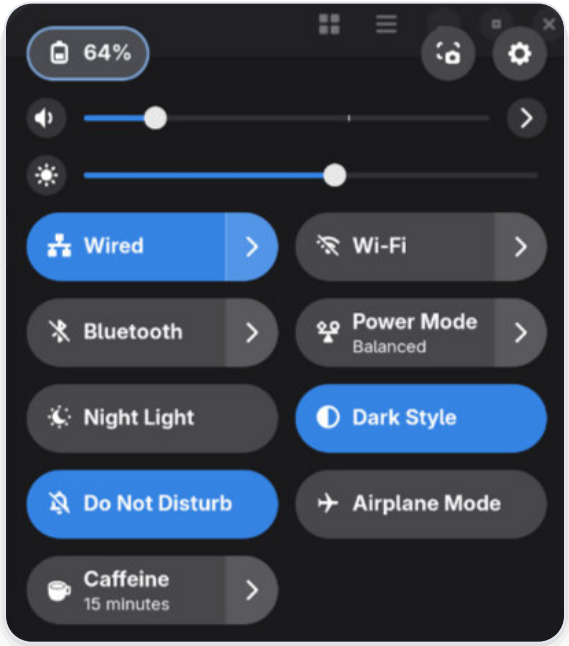

- **Counts down in the top bar** the window gets out of your way
- **Screensavers over your work** Bubbles, Mystify, Starfield or a calm full-screen view
- **Quiet while you focus** notifications wait until you're done
- **A celebration, not an alarm** a little pixel party when time's up

THE TOP BAR

Everything you check, one click away

System monitor: honest numbers, no clutter

Quick Settings

- **System monitor** a tiny CPU graph and temperature; click for memory, disk, network, battery draw and the busiest apps
- **Clipboard history** Super+V brings back anything you copied
- **Keep awake** one switch stops the screen from sleeping during a film or a long download
- **Your tray icons** Spotify, chat apps and game launchers show up like on any other desktop

APPS

Installed and ready on first login

Zen Browser

Joplin

ONLYOFFICE

VS Code

Spotify

Lutris

Extension Manager

SonoBus

Frog

FlipClock

MK Notes

Companion

Focus Timer

Shortcuts

Plus full video and audio codecs, hardware video decoding for your graphics card, a modern terminal toolkit, gaming helpers and developer tools. Every app list is a plain text file: add or remove a line and it's yours. Bold ones are made for MK Workstation.

YOUR COMPUTER

It looks at your hardware, then tunes for it

Fingerprint and face unlock

if your computer has a reader or an IR camera, logging in is a touch or a glance

Battery that lasts

full speed when plugged in, balanced on battery, power-saver when it runs low

Speakers with body

laptop speakers get warmth, bass they can actually play, and clearer voices

Touchscreens and 2-in-1s

rotation and tablet mode just work; MK Notes takes a pen

The right graphics driver

hardware video decoding for Intel, AMD or NVIDIA

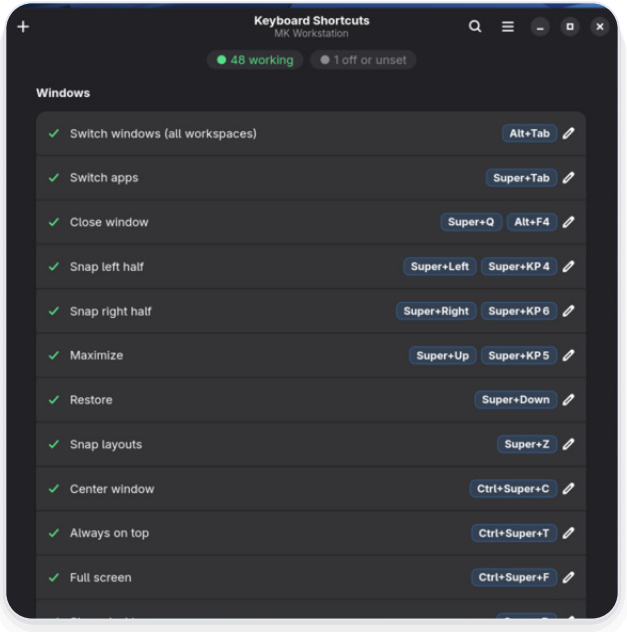

Older machines too

mk effects lite turns off heavy effects; mk device shows what was found

KEYBOARD

Coming from Windows or a Mac? Your hands already know these.

Super+E	Files	**Super+N**	MK Notes
Super+B	Web browser	**Super+V**	Clipboard history
Super+Shift+S	Screenshot an area	**Super+Shift+T**	Copy text from the screen
Super+Z	Snap layouts	**Super+L**	Lock
Ctrl+Shift+Esc	System Monitor	**Super+.**	Emoji
Super+Q	Close window	**Ctrl+Alt+T**	Terminal
Ctrl+Alt+End	Shut down (asks first)	**Ctrl+Alt+Home**	Restart (asks first)

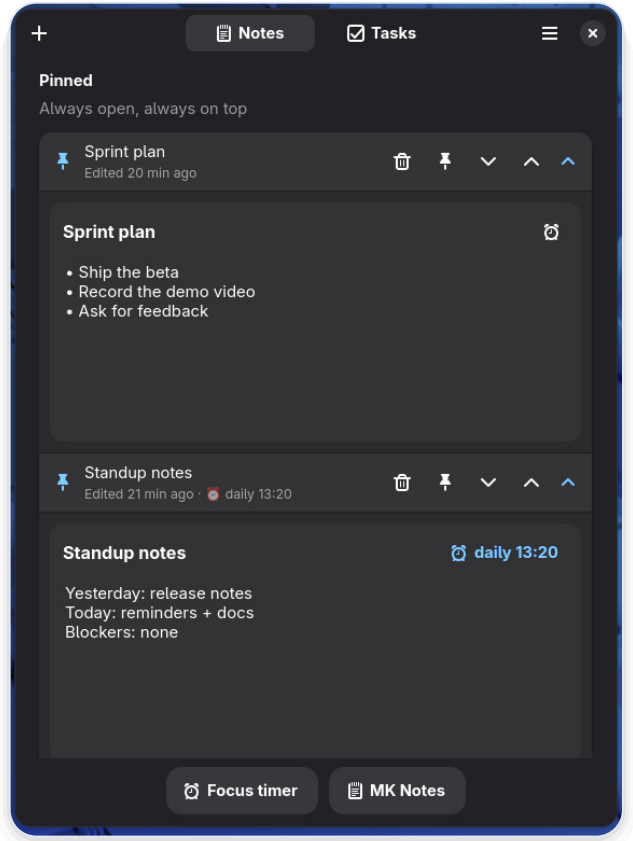

Super+/ shows them all, live, and lets you change any key

NO RISK

Try it. Change your mind. Nothing breaks.

- **A snapshot every time** your settings are saved before every change; mk restore puts them back
- **One-line uninstall** mk uninstall removes MK's tools and shortcuts from your account
- **Health check** mk doctor finds broken extensions, clashing keys, missing codecs, and tells you the fix
- **Readable** plain shell and Python you can read in an afternoon; every change is in the git history
- **Yours to change** rename it, swap any app, key or colour without touching the scripts
- **Updates in one go** mk update: system, apps, extensions and settings together

The Companion (Super+Shift+N): quick notes, tasks and reminders

GET STARTED

Three commands on a fresh Fedora Workstation

```
1  git clone https://github.com/MehulK-techie/fedora-workstation-config.git
```

```
2  cd fedora-workstation-config
```

```
3  sudo ./setup.sh
```

Then log out and back in. That's it. Everything after that is optional: **mk doctor** to check, **mk** to see every command.
